

Control Systems - 7th Semester

Lecture 3

Model of Systems

Last week, we studied about transfer function models

Last week, we also studied how to obtain poles, zeros, and analyze stability of transfer function model

Last week, we also studied a new language of modelling which is called as state-space modelling

Last week, we also studied about obtaining state-space models from differential equations

This week, we will study the conversion techniques from state-space models to transfer function models (and vise versa)

Converting State Space to Transfer Function

The general form or template of ss model is as follows:

$$\dot{x} = Ax + Bu(t)$$

$$y = Cx + Du(t)$$

Let G(s) denote the transfer function after converting to transfer function domain. The formula is:

$$G(s) = D + C[(sI - A)^{-1}B]$$

Convert the following state-space model to transfer function

$$\dot{x} = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} x + \begin{bmatrix} 5 \\ 6 \end{bmatrix} u(t)$$
$$y = \begin{bmatrix} 1 & 2 \end{bmatrix} x$$

Let us first obtain $(sI - A)^{-1}$

$$I = egin{bmatrix} 1 & 0 \ 0 & 1 \end{bmatrix}$$

$$sI = egin{bmatrix} s & 0 \ 0 & s \end{bmatrix}$$

$$sI-A=egin{bmatrix} s&0\0&s\end{bmatrix}-egin{bmatrix}1&2\3&4\end{bmatrix}=egin{bmatrix}s-1&-2\-3&s-4\end{bmatrix}$$

$$sI-A=egin{bmatrix} s-1 & -2 \ -3 & s-4 \end{bmatrix}$$

Now let us find $(sI-A)^{-1}$

$$(sI - A)^{-1} = \frac{\operatorname{adjoint}(sI - A)}{\det(sI - A)}$$

$$\operatorname{adjoint}(sI-A) = egin{bmatrix} s-4 & 2 \ 3 & s-1 \end{bmatrix}$$

$$det(sI - A) = (s - 1)(s - 4) - (-2)(-3)$$
$$= (s^2 - 5s + 4) - (6)$$
$$= s^2 - 5s + 4 - 6$$
$$= s^2 - 5s - 2$$

$$(sI-A)^{-1}=rac{\operatorname{adjoint}(sI-A)}{\det(sI-A)}=rac{1}{s^2-5s-2}egin{bmatrix}s-4 & 2\ 3 & s-1\end{bmatrix}$$

Next, we post-multiply with matrix **B** as follows:

$$(sI - A)^{-1} \times B = \frac{1}{s^2 - 5s - 2} \begin{bmatrix} s - 4 & 2 \\ 3 & s - 1 \end{bmatrix} \times \begin{bmatrix} 5 \\ 6 \end{bmatrix}$$

$$=\frac{1}{s^2-5s-2}\begin{bmatrix}\left((s-4)\times 5\right)+\left(2\times 6\right)\\\left(3\times 5\right)+\left((s-1)\times 6\right)\end{bmatrix}$$

$$=\frac{1}{s^2-5s-2}\begin{bmatrix}5s-20+12\\15+6s-6\end{bmatrix}$$

$$=\frac{1}{s^2-5s-2}\begin{bmatrix}5s-8\\6s+9\end{bmatrix}$$

Now, let us pre-multiply with matrix *C* as follows:

$$C(sI - A)^{-1}B = \frac{1}{s^2 - 5s - 2} \begin{bmatrix} 1 & 2 \end{bmatrix} \times \begin{bmatrix} 5s - 8 \\ 6s + 9 \end{bmatrix}$$

$$= \frac{1}{s^2 - 5s - 2} \begin{bmatrix} 1 \times (5s - 8) + 2 \times (6s + 9) \end{bmatrix}$$

$$=\frac{1}{s^2-5s-2} \left[5s-8+12s+18 \right]$$

$$=\frac{1}{s^2-5s-2} \left[17s+10 \right]$$

$$=\frac{17s+10}{s^2-5s-2}$$

Convert the following state-space model to transfer function

$$\dot{x} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & -2 & -3 \end{bmatrix} x + \begin{bmatrix} 10 \\ 0 \\ 0 \end{bmatrix} u(t)$$
$$y = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix} x$$

Let us first obtain (sI - A)

$$(s\mathbf{I} - \mathbf{A}) = \begin{bmatrix} s & 0 & 0 \\ 0 & s & 0 \\ 0 & 0 & s \end{bmatrix} - \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & -2 & -3 \end{bmatrix} = \begin{bmatrix} s & -1 & 0 \\ 0 & s & -1 \\ 1 & 2 & s+3 \end{bmatrix}$$

Now let us find $(sI - A)^{-1}$

$$(s\mathbf{I} - \mathbf{A})^{-1} = \frac{\text{adj}(s\mathbf{I} - \mathbf{A})}{\det(s\mathbf{I} - \mathbf{A})} = \frac{\begin{bmatrix} (s^2 + 3s + 2) & s + 3 & 1 \\ -1 & s(s + 3) & s \\ \\ -s & -(2s + 1) & s^2 \end{bmatrix}}{s^3 + 3s^2 + 2s + 1}$$

Next, we post-multiply with matrix **B** as follows:

$$(sI - A)^{-1} \times B = \frac{1}{s^3 + 3s^2 + 2s + 1} \begin{bmatrix} (s^2 + 3s + 2) & s + 3 & 1 \\ -1 & s(s + 3) & s \\ -s & -(2s + 1) & s^2 \end{bmatrix} \times \begin{bmatrix} 10 \\ 0 \\ 0 \end{bmatrix}$$

$$(sI - A)^{-1} \times B = \frac{1}{s^3 + 3s^2 + 2s + 1} \begin{bmatrix} 10s^2 + 30s + 20 \\ -10 \\ -10s \end{bmatrix}$$

$$C(sI - A)^{-1}B = \frac{1}{s^3 + 3s^2 + 2s + 1} \begin{bmatrix} 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} 10s^2 + 30s + 20 \\ -10 & \\ -10s \end{bmatrix}$$

$$C(sI - A)^{-1}B = \frac{1}{s^3 + 3s^2 + 2s + 1} \left[1 \times \left(10s^2 + 30s + 20 \right) + 0 \times (-10) + 0 \times (-10s) \right]$$

$$G(s) = C(sI - A)^{-1}B = \frac{10(s^2 + 3s + 2)}{s^3 + 3s^2 + 2s + 1}$$

MATLAB code for conversion of ss to tf

```
A = [0 \ 1 \ 0; \ 0 \ 0 \ 1; \ -1 \ -2 \ -3];
B = [10; 0; 0];
C = [1 \ 0 \ 0];
D = [0];
[num,den] = ss2tf(A,B,C,D);
g = tf(num,den)
```

```
Transfer function:
10 s^2 + 30 s + 20
-----
s^3 + 3 s^2 + 2 s + 1
```

Conversion from tf to ss

Converting from tf to state-space is not unique process

There are various techniques to convert form transfer function domain to state-space domain

We call each technique as canonical form. Let us study the first canonical form

For nth order transfer function:

$$G(s) = \frac{b_{n-1}s^{n-1} + b_{n-2}s^{n-2} + \cdots + b_1s^1 + b_0}{s^n + a_{n-1}s^{n-1} + a_{n-2}s^{n-2} + \cdots + a_1s + a_0}$$

$$A = egin{bmatrix} 0 & 1 & 0 & \dots & 0 \ 0 & 0 & 1 & \dots & 0 \ dots & dots & dots & dots & dots \ 0 & 0 & 0 & 0 & 1 \ -a_0 & -a_1 & -a_2 & -a_{n-2} & -a_{n-1} \end{bmatrix}$$

$$B = egin{bmatrix} oldsymbol{b_{n-1}} \ oldsymbol{b_{n-2}} \ oldsymbol{b_1} \ oldsymbol{b_0} \end{bmatrix}$$

$$C = [1 \ 0 \ 0 \ ... \ 0]$$

For a 2nd order transfer function:

$$G(s) = \frac{b_1 s^1 + b_0}{s^2 + a_1 s + a_0}$$

$$A = \begin{bmatrix} 0 & 1 \\ -a_0 & -a_1 \end{bmatrix} \qquad B = \begin{bmatrix} b_1 \\ b_0 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 0 \end{bmatrix}$$

For a 3rd order transfer function:

$$G(s) = \frac{b_2 s^2 + b_1 s^1 + b_0}{s^3 + a_2 s^2 + a_1 s + a_0}$$

$$A = egin{bmatrix} 0 & 1 & 0 \ 0 & 0 & 1 \ -a_0 & -a_1 & -a_2 \end{bmatrix}$$

$$B = \begin{bmatrix} b_2 \\ b_1 \\ b_0 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix}$$

For a 4th order transfer function:

$$G(s) = \frac{b_3 s^3 + b_2 s^2 + b_1 s^1 + b_0}{s^4 + a_3 s^3 + a_2 s^2 + a_1 s + a_0}$$

$$A = egin{bmatrix} 0 & 1 & 0 & 0 \ 0 & 0 & 1 & 0 \ 0 & 0 & 0 & 1 \ -a_0 & -a_1 & -a_2 & -a_3 \end{bmatrix}$$

$$B = \begin{bmatrix} b_3 \\ b_2 \\ b_1 \\ b_0 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 0 & 0 & 0 \end{bmatrix}$$

Example: Convert the following transfer function to state-space domain

$$G(s) = \frac{24}{s^3 + 9s^2 + 26s + 24}$$

Solution: In this example, $a_0 = 24$, $a_1 = 26$, $a_2 = 9$, and $b_0 = 24$, we can obtain the following:

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -24 & -26 & -9 \end{bmatrix}$$

$$B = \begin{bmatrix} 0 \\ 0 \\ 24 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix}$$

Example: Convert the following transfer function to state-space domain

$$G(s) = \frac{s^2 + 7s + 2}{s^3 + 9s^2 + 26s + 24}$$

Solution: In this example, $a_0 = 24$, $a_1 = 26$, $a_2 = 9$, and $b_0 = 2$, $b_1 = 7$, and $b_2 = 1$, we can obtain the following:

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -24 & -26 & -9 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 \\ 7 \\ 2 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix}$$

This is another canonical form which is as follows:

$$G(s) = \frac{b_{n-1}s^{n-1} + b_{n-2}s^{n-2} + \cdots + b_1s^1 + b_0}{s^n + a_{n-1}s^{n-1} + a_{n-2}s^{n-2} + \cdots + a_1s + a_0}$$

$$A = \begin{bmatrix} 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & 1 \\ -a_0 & -a_1 & -a_2 & -a_{n-2} & -a_{n-1} \end{bmatrix} \qquad B = \begin{bmatrix} 0 \\ 0 \\ \vdots \\ 0 \\ 1 \end{bmatrix}$$
 $C = \begin{bmatrix} b_0 & b_1 & b_2 & \dots & b_{n-1} \end{bmatrix}$

What is the difference between this canonical form and the previous one?

Matrix B in canonical form 2 seems like transpose of matrix C in the (previous) canonical

form 1 and vice versa

Example: Convert following transfer function to state-space domain using canonical form 2

$$G(s) = \frac{s^2 + 7s + 2}{s^3 + 9s^2 + 26s + 24}$$

Solution:

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -24 & -26 & -9 \end{bmatrix}$$

$$B = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$$

$$C = [2 \ 7 \ 1]$$

Controller Canonical Form - Canonical Form 3

This is another canonical form called controller canonical form which is as follows:

$$G(s) = \frac{b_{n-1}s^{n-1} + b_{n-2}s^{n-2} + \cdots + b_1s^1 + b_0}{s^n + a_{n-1}s^{n-1} + a_{n-2}s^{n-2} + \cdots + a_1s + a_0}$$

$$m{A} = egin{bmatrix} -a_{n-1} & -a_{n-2} & \cdots & -a_1 & -a_0 \ 1 & 0 & \cdots & 0 & 0 \ 0 & 1 & \cdots & 0 & 0 \ dots & dots & \ddots & dots & dots \ 0 & 0 & \cdots & 1 & 0 \end{bmatrix} \qquad m{B} = egin{bmatrix} 1 \ 0 \ dots \ 0 \ 0 \end{bmatrix}$$

$$C = \begin{bmatrix} b_{n-1} & b_{n-2} & b_{n-3} & \dots & b_0 \end{bmatrix}$$

Conversion from tf to ss - Controller Canonical Form

Example: Convert the following transfer function to state-space domain using controller canonical form

$$G(s) = \frac{s^2 + 7s + 2}{s^3 + 9s^2 + 26s + 24}$$

Solution:

$$A = \begin{bmatrix} -9 & -26 & -24 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

$$C = [1 \ 7 \ 2]$$

Observer Canonical Form - Canonical Form 4

Another canonical form is observer canonical form which is as follows:

$$G(s) = \frac{b_{n-1}s^{n-1} + b_{n-2}s^{n-2} + \cdots b_{1}s^{1} + b_{0}}{s^{n} + a_{n-1}s^{n-1} + a_{n-2}s^{n-2} + \cdots a_{1}s + a_{0}}$$

$$A = \begin{bmatrix} -a_{n-1} & 1 & 0 & \cdots & 0 \\ -a_{n-2} & 0 & 1 & \cdots & 0 \\ -a_{n-3} & 0 & 0 & \cdots & 0 \\ -a_{n-3} & 0 & 0 & \cdots & 0 \end{bmatrix}$$

$$B = \begin{bmatrix} b_{n-1} \\ b_{n-2} \\ \vdots \\ b_{1} \\ b_{0} \end{bmatrix}$$

$$\vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \\ -a_{1} & 0 & \cdots & 0 & 1 \\ -a_{0} & 0 & \cdots & 0 & 0 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 0 & 0 & \dots & 0 \end{bmatrix}$$

Example: Convert the following transfer function to state-space domain using observer canonical form

$$G(s) = \frac{s^2 + 7s + 2}{s^3 + 9s^2 + 26s + 24}$$

Solution:

$$A = \begin{bmatrix} -9 & 1 & 0 \\ -26 & 0 & 1 \\ -24 & 0 & 0 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 \\ 7 \\ 2 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix}$$

MATLAB code for conversion from tf to ss

MATLAB code for conversion of tf to ss

```
num=[1 7 2];
```

den=[1 9 26 24];

[A, B, C, D]=tf2ss(num,den)

Aobsv=A'

Bobsv=B'

Cobsv=C'

Dobsv=D'

Common mistake by students using MATLAB code

Students think they are good programmers. They think they may used short variables. So, use the alphabet *n* for *num* and *d* for *den*

$$n=[172]$$
;

$$[a, b, c, d] = tf2ss(n, d)$$

Problem in above code: state-space matrix **d** and transfer function denominator **d** have same alphabets
